ClearJet A2000 Spray Fixative Coating

Description

ClearJet A2000 by **Landor UK** is a premium-quality inkjet print spray developed specifically for the fine art, photographic and professional markets. Landor ClearJet protects your image with an easy-to-use, flexible spray coating laminate and is compatible with most inkjet-printable media. ClearJet is guaranteed to extend the life of your prints and resist all the elements that would otherwise limit their life without this protective coating. Because of the limitations of desktop and photo printers, and of dye and pigment inks in particular, exposure to water, abrasion and UV light will limit the life of your inkjet prints. You can even wash prints coated with ClearJet. Landor ClearJet liquid laminate spray coatings are compatible with most substrates, including canvas, vinyl (enamel-receptive and non-enamel-receptive), paper, banners, fibreglass, PVC, metal, plastic and wood. Landor ClearJet is optimised for standard (water-based) inks and works equally well with most solvent, eco-solvent, latex and UV inks, applied from an aerosol can or by spray. You can further enhance print quality with a choice of gloss and semi-gloss finishes. For more details, see our product information: **All about ClearJet Inkjet Sprays.** For more on protecting inkjet prints generally, see our page on **Protecting Inkjet Prints**.

Please note: to fully protect your prints, all inkjet sprays contain solvent, so they should be used in well-ventilated work areas. This is the only technology available for paper prints. However, if you have films or canvas and would prefer a water-based protective coating laminate, please contact us.
