

What Are Clear Coatings and Liquid Laminates?

Description

default watermark

Clear coatings, liquid laminates or Giclee varnish are an inexpensive way to protect your prints, digital wall coverings and fine art reproduction. These could be canvas, signs and banners and also soft signage, such as truck sides and awnings.

Liquid laminates are cost effective, easy to apply, and do not require expensive equipment. Some can even be applied by a hand roller.

Liquid laminates feature the most current innovations in ultraviolet light absorbers and light stabilisers that offer protection for many products.

Use liquid laminates for:

- Digital inkjet output
- Printed and airbrushed products
- Truck curtain sides
- Bouncy Castles & Soft Child Play
- Outdoor Promotionals and Branding Events
- Traditional signage

- Fine Art Giclee including canvas
- Vehicle graphics (vehicle wraps)
- Digital wall coverings (wallpaper)
- Indoor and Outdoor protection plus anti graffiti protection
- Outdoor hoarding
- Flex face Signage
- Vehicle Wraps

Protect, Preserve, Enhance, and Extend the life of your digital prints against the effects of water, chemicals, Pollution, abrasion, and UV fade.

Liquid Laminates have been specially developed to:

- Protect inks from ultraviolet exposure
- Protect inks from abrasion and marring
- Provide resistance to chemicals and water
- Enhance Digital images
- Refresh images and Preserve them

Film lamination adheres to the printed media and comes in two types; Pressure Sensitive adhesive that only needs pressure to stick, or Heat Sensitive type that is only sticky when heat is applied. In some cases the added rigidity of film lamination does not meet the criteria for the applications, for example Digital Wallpaper, Canvas, Truck Curtains and Vehicle Graphics.

The natural bond of liquid laminates, without the use of pressure/heat sensitive adhesives, as with film lamination, plus its greater flexibility when applying onto most surfaces, can make Liquid lamination more suitable than conventional lamination film.

Film lamination is more suitable when rigidity is needed for example with Pop Up displays, however if adhesive bond, de-lamination or compatibility of laminates to the printed substrate is an issue, then Liquid lamination can be a safer option.
